

Blend Shader For Polybrush

V1.0

This Blend Shader is designed to work with Unity's official Polybrush package, allowing you to paint vertex colors using Polybrush. When used in conjunction with this shader, it enables blended material effects. The colors black, red, green, and blue applied with Polybrush correspond to Layer0 through Layer3.

There are two different versions: VertexBlendSimple and VertexBlendPbr. The Pbr version of the shader includes a MaskMap that is compatible with Unity's Terrain Layer Texture. The shader features a custom inspector that is easy to understand.

The shader is developed using Shader Graph, allowing users to modify it as needed. The MaskMap can be generated using another resource of mine called "TextureMerger".

Quick start

1. Install Polybrush via the Package Manager.
2. Import this plugin package, making sure to import the package for the corresponding rendering pipeline.
3. Select the model you want to paint, and create a new material using Shader Graphs/Hong.VertexBlendSimple or Shader Graphs/Hong.VertexBlendPbr.
4. Set the textures for the material.
5. Use Polybrush to paint the vertex colors.
